

Bridges & footbridges

Bridges and footbridges made of wood are ideal for traversing riverbeds and low terrain. Their strong, natural presence makes them fit in and harmonize with their surroundings. Quality begins with the selection of the wood. Our bridges are made of select oak and black locust, or these woods together with glulam timber. This creates longer-lasting constructions.

Every bridge, every footbridge is also unique masterwork of craftsmanship, planned and built according to your individual specifications.

*Smart construction and design suited to the landscape -- "Made by HOMBACH".
Our company manufactured and built this special wooden bridge, which was installed on the plateau of the Loreley crag It bridges a ravine on the storied cliff and gives visitors a view of the breathtaking Rhein panorama.*

An especially attractive bridge design. The wooden roof not only helps people to stay dry while getting to the other end of the bridge, it also protects the planking and superstructure from the effects of weather.

Our bridge-like footbridges made of roundwood are protected by a utility patent at the German Patent Office.

From light arch-shaped footbridges, to stable bridges capable of bearing vehicular traffic, a common standard applies: they are custom made for their terrain and requirements; and they are robust, standing up to weather effects and loads.

It was christened in the year 2000 as part of the globally recognized "Echo Loreley" expo project.
